Milestone 2 – Exploratory Data Analysis (EDA)

This notebook reproduces the Exploratory Data Analysis described in the Milestone 2 PDF using the actual train/validation/test JSON splits.

```
# Import libraries
import json
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from pathlib import Path

sns.set(style="whitegrid", palette="pastel", context="notebook")
plt.rcParams['figure.figsize'] = (8,5)
plt.rcParams['axes.titlesize'] = 14
plt.rcParams['axes.labelsize'] = 12
plt.rcParams['xtick.labelsize'] = 11
plt.rcParams['ytick.labelsize'] = 11
```

```
# Load train / validation / test JSON files
DATA_DIR = Path('/content')

with open(DATA_DIR / 'train.json') as f:
    train = json.load(f)
with open(DATA_DIR / 'validation.json') as f:
    val = json.load(f)
with open(DATA_DIR / 'test.json') as f:
    test = json.load(f)

train_df = pd.DataFrame(train).assign(split='train')
val_df = pd.DataFrame(val).assign(split='validation')
test_df = pd.DataFrame(test).assign(split='test')

full_df = pd.concat([train_df, val_df, test_df], ignore_index=True)
print('Total prompts:', len(full_df))
full_df.head()
```

```
Total prompts: 20137
```

```

Conclusion

This EDA confirms that the dataset is attack-heavy, that jailbreak prompts are significantly longer than benign prompts, and that train/validation/test splits are well-stratified with no detectable family-level leakage. These properties make the dataset suitable for training and evaluating inference-time LLM guardrails, consistent with the findings reported in the Milestone 2 PDF.
